

EXECUTIVE BRIEFING

AI-Governed Service Delivery

From ticket intake to compliant release — autonomous where it is safe, human-approved where it counts.

ServiceNow

Jira

Amazon Bedrock

Devin

Harness

Five stages, one governed path.

Bedrock qualifies the work · Devin does the work · Harness proves it is safe · a person approves the release

RETURN PATHS THAT PROTECT THE PIPELINE

↺ Duplicate or thin ticket → returned at the gate

↺ Failed scan or review → Devin reworks the fix

↺ Resolved outcomes → sharper playbooks

HUMAN CONTROL POINTS

● Intake owner
business priority

● Triage thresholds
tuned, not guessed

● Pull request review
every change is read

● Harness approval
release needs a person

● Audit trail
ticket → PR → deploy

No work starts until the ticket earns it.

Amazon Bedrock evaluates every ticket before a single engineering cycle — human or AI — is spent.

01 Is it new?

Semantic comparison against ticket history clusters repeats and links them to the open parent.

02 Is it complete?

Repro steps, logs, environment, affected system and scope are scored against a required-detail standard.

03 Is it eligible?

Category, blast radius and risk decide autonomous fix, assisted fix, or human-only.

Gate outcomes

Returned

duplicate, or too thin to act on

Escalated

high risk or policy-restricted → human-only

Qualified

scoped, evidenced, safe → handed to Devin

WHY THIS MATTERS

Repeat and low-quality tickets are the largest hidden cost in service desks. Screening them at the gate protects engineering capacity, keeps automation trustworthy, and gives the business a clean signal on real demand.

Devin executes the qualified ticket, end to end.

Automations decide when work starts. Playbooks decide how it is done. Every run ships evidence, not just code.

Automations

Event-driven start

- Fires on ticket creation or a “Ready for AI” transition
- No queue, no triage meeting, no assignment delay
- Scope and guardrails come from the ticket itself

Playbooks

Repeatable method

- Curated, tested procedure per class of work
- Same steps, same checks, every single time
- Improved as outcomes come back from stage 5

Devin never releases anything on its own — stage 3 always ends at a reviewable pull request.

Compliance enforced by the pipeline.

Harness runs the same governed gate on AI-authored and human-authored changes alike.

Build

SAST

Dependency &
secrets

IaC policy

Compliance
evidence

Human approval

Deploy

What the gate enforces

- Static analysis and dependency risk on every change
- No secrets, no unreviewed IaC or policy drift
- Scan results attached to the change, not to a spreadsheet
- Promotion blocked until a named approver signs off
- Rollback path recorded before deploy

The person stays in the loop

The approver sees the ticket, the AI reasoning, the diff and the scan results in one place — then approves, rejects, or sends it back.

UNBROKEN AUDIT TRAIL

Ticket

Session log

Pull request

Scan results

Approval

Release

Nothing AI-authored reaches production without passing the same compliance scans and a named human approval.

Capacity back, risk down, evidence by default.

What changes when qualification, execution and compliance are automated around the same ticket.

Ticket deflection

Repeats resolved by linkage instead of new work

measured per stage

Cycle time

Qualified ticket → approved release

measured per stage

Autonomous fix rate

Share of tickets resolved without hands-on engineering

measured per stage

Gate pass rate

AI changes clearing compliance on first submission

measured per stage

Today

- × Repeat tickets re-investigated from scratch
- × Thin tickets bounce between queues for days
- × Compliance evidence assembled by hand, late
- × Fix quality depends on who picked up the ticket

With this pipeline

- ✓ Repeats linked and closed at intake
- ✓ Tickets qualified before capacity is spent
- ✓ Scans and approvals captured on every change
- ✓ Playbooks make the best method the default

Next step: pick two ticket classes, run the pipeline end to end, and publish the four metrics above.
